

BROMELIADS

Native to Central and South America, bromeliads are a large family of plants – all with a similar rosette of stiff leaves and some kind of bright central flower spike or colored leaf area. They're tough, easy-going plants, preferring bright, indirect light or direct sun.

Keep their soil moist to dry, and pour the water in the center of the plant where the leaves join together, allowing it to drain into the soil. Avoid letting the plant sit in water. If you live in a hard water area, use rainwater or distilled water whenever possible, as bromeliads are very sensitive to salts, which may cause their leaves to turn brown at the tips.
